

# Conjoint.ly

Redirects can be implemented under “Advanced settings” tab. Following up with the screenshot here, please note that they would have to tick the “Append all GET variables” box to ensure that GUID is passed.

The screenshot displays the 'Set up a new generic conjoint' configuration page. At the top, there are five tabs: 'Basic settings', 'Select and edit template', 'Choose participants', 'Advanced settings' (highlighted with a red box), and 'Additional questions'. Below the tabs is a blue header for the 'Redirects upon survey completion' section. The main content area contains a question: 'Would you like the participants to be redirected to another page when the survey is complete?' followed by a sub-question: 'You can use redirect links to integrate with another survey platform.' Below this, there are three sections for different response types: 'URL for complete responses', 'URL for screened-out responses', and 'URL for low quality responses'. Each section has a text input field with a placeholder URL (e.g., 'https://s.cint.com/Survey/Complete?ProjectToken=XXXXXX') and a checkbox labeled 'Append all GET variables', which is checked in all three sections. A red box highlights the 'Append all GET variables' checkbox for the 'complete responses' section. Below each input field is a note: 'Make sure to include "http://" or "https://", or leave blank for no redirect.' At the bottom of the form is a blue bar for 'Translation into other languages'. At the very bottom, there are buttons for 'Preview survey as participant', 'Other actions', 'Save changes', and 'Save and review'.
